

Dr. John Morse is a Professor of Entomology at Clemson University. He has taught courses related to aquatic insects at Clemson, at Highlands Biological Station in North Carolina, and in several countries in East Asia for more than 30 years. His research specialty is the identification, biology, and historical development of caddisflies, which he has studied in many streams of the world since 1967. Dr. Morse and his students also investigate the identification, biology, and distribution of other aquatic insects, of stream ecology and conservation, and of the use of insect communities to monitor water pollution.
